A DISEASE TO BE WARY OF
TESTICULAR CANCER
เจาะลึก 'มะเร็งต่อมลูกหมาก'

Among all the malignant tumors found in men, testicular cancer is one of the most common. In fact, statistics indicate that testicular cancer is the most commonly found type of malignancy in Europe and the United States. Evidence also shows that it is one of the major causes of death, second only to lung cancer. Men at the age of 50 and older are at risk, while men aged 60–80 are the most at risk. From these figures, we can draw a conclusion that the risk of developing this type of cancer increases with each passing year.
Dealing with testicular cancer depends on the type of the tumor, its current stage, and results of PSA screening. The best possible way is to closely monitor it while it's being treated until no evidence of its presence can be detected.
